

ADHD Statistics Parents Should Be Aware of

Visit my blog at <http://bit.ly/2z518MM> to see the sources for this information.

1

ADHD is the most treatable condition in psychiatry, and yet 40% of ADHD children and 90% of ADHD adults are not recognized and treated for their ADHD meaning that real the issue is under-treatment, not over-treatment.

2

80% of people with ADHD will be on medications at some point in their life which is a good thing because ADHD is a neurogenetic disorder and ADHD medication is an effective, proven neurogenetic therapy making medication completely justifiable.

3

Less than 20% of adults with ADHD have been diagnosed and treated.

4

Approximately 2 million children in the USA have ADHD which means that in a classroom of 30 children, at least one will have ADHD.

5

Only 50% of young children with ADHD are receiving services for their ADHD.

6

At least 50% of ADHD children have a comorbidity or additional psychiatric condition.

7

About 80% of ADHD patients respond positively to medication.

8

When ADHD people use stimulant medication it lessens --not increases-- the likelihood that they'll abuse drugs and alcohol.

9

ADHD people often use drugs and alcohol as self-medication which would likely be reduced if they were medicated properly.

10

Exercise helps ADHD more than any other psychological disorder, so everyone who has ADHD should be in an exercise program of some kind.
